

## 20. PHP File Handling

The `fopen()` function is used to open files in PHP.

### 20.1. Opening a File

The `fopen()` function is used to open files in PHP.

The first parameter of this function contains the name of the file to be opened and the second parameter specifies in which mode the file should be opened:

```
<html>
<body>

<?php
$file=fopen("welcome.txt","r");
?>

</body>
</html>
```

The file may be opened in one of the following modes:

Modes	Description
r	Read only. Starts at the beginning of the file
r+	Read/Write. Starts at the beginning of the file
w	Write only. Opens and clears the contents of file; or creates a new file if it doesn't exist
w+	Read/Write. Opens and clears the contents of file; or creates a new file if it doesn't exist
a	Append. Opens and writes to the end of the file or creates a new file if it doesn't exist
a+	Read/Append. Preserves file content by writing to the end of the file
x	Write only. Creates a new file. Returns FALSE and an error if file already exists
x+	Read/Write. Creates a new file. Returns FALSE and an error if file already exists

**Note:** If the `fopen()` function is unable to open the specified file, it returns 0 (false).

## Example

The following example generates a message if the fopen() function is unable to open the specified file:

```
<html>
<body>

<?php
$file=fopen("welcome.txt","r") or exit("Unable to
open file!");
?>

</body>
</html>
```

## 20.2. Closing a File

The fclose() function is used to close an open file:

```
<?php
$file = fopen("test.txt","r");

//some code to be executed

fclose($file);
?>
```

## 20.3. Check End-of-file

The feof() function checks if the "end-of-file" (EOF) has been reached.

The feof() function is useful for looping through data of unknown length.

**Note:** You cannot read from files opened in w, a, and x mode!

```
if (feof($file)) echo "End of file";
```

## 20.4. Reading a File Line by Line

The `fgets()` function is used to read a single line from a file.

**Note:** After a call to this function the file pointer has moved to the next line.

### Example

The example below reads a file line by line, until the end of file is reached:

```
<?php
$file = fopen("welcome.txt", "r") or exit("Unable
to open file!");
//Output a line of the file until the end is
reached
while(!feof($file))
{
    echo fgets($file). "<br>";
}
fclose($file);
?>
```

## 20.5. Reading a File Character by Character

The `fgetc()` function is used to read a single character from a file.

**Note:** After a call to this function the file pointer moves to the next character.

### Example

The example below reads a file character by character, until the end of file is reached:

```
<?php
$file=fopen("welcome.txt","r") or exit("Unable to
open file!");
while (!feof($file))
{
    echo fgetc($file);
}
fclose($file);
?>
```

## 20.6. PHP Filesystem Reference

For a full reference of the PHP filesystem functions, visit our [PHP Filesystem Reference](#).
